Empowering Anesthesiology.
The new LOGIQ™ e Ultrasound System
Challenges in Anesthesiology

A fast and accurate regional block requires seeing the nerve fast and then accurate needle guidance. That’s what anesthesiologists told GE scientists. Even more, they asked for help to see the needle tip, perform procedures quickly, and be confident that the injection was administered in the correct location… even in obese patients.

Designed for Anesthesiology

See clearly. See quickly. Guide precisely. Those were the values that users requested that drove the creation of the new LOGIQ e. It’s imaging engine comes from GE’s flagship console systems, delivering crisp images in a compact package. Innovative anesthesia-specific software and transducers help you see the needle and administer a block… even in a brightly lit room.

Simple

The LOGIQ e gives you many advanced features and the right-out-of-the-box imaging – optimized for anesthesia helps make the technology transparent so that you can focus on the patient.

- Set up for you. Head to toe, every block is different. The LOGIQ e’s presets helps simplify the selection of the right system settings for each application.
- Workhorse simplicity: The versatility of probes like the 12L mean you can use a single probe for many applications.
- Simple documentation. One click sends images to multiple storage locations.

Fast

Whether you’re measuring seconds for clinical reasons, or you’re measuring productivity for business reasons, the LOGIQ e is built to help make you fast. The compact system quickly moves from patient to patient.

- Need a third hand? With a needle in one hand, a probe in the other, sometimes you need another person to adjust the image. With system controls on the probe, you may not need the extra hand.
- Imaging on the go. Compact and battery-operated, the LOGIQ e takes the hassle out of moving from patient to patient.

Precise

Getting the needle in the right place the first time on all patient types is key to patient comfort. Crisp imaging is at the core of the LOGIQ e.

- See the needle tip. The LOGIQ e uses two different types of ultrasound: One for tissue and one for metal. This makes the needle stand out and allows separate control of its appearance.
- See the nerve. Tissue differentiation matters. The LOGIQ e’s imaging engine is optimized to help make the nerve stand out.
Brachial Plexus Nerve at the Interscalene level is clearly delineated between the Scalene muscles while utilizing the 12L

Infraclavicular Brachial Plexus Nerve is well seen surrounding the Axillary Artery between the two fascial planes imaged on the L4-12t

Clarity of the median nerve sheath shows excellent spatial resolution delivered by the L4-12t

See the individual fascials of the nerve bundles at 22MHz imaging on the L10-22

Excellent definition of cystic clarity of the Carotid Artery aids the ability to demonstrate the Phrenic Nerve imaged on the L4-12t

The Supraclavicular Brachial Plexus Nerve bundle is easily confirmed while applying Power Doppler utilizing the L4-12t

Needle and needle tip are clearly demonstrated approaching the Transverse Abdominus muscle for TAP block procedure
Portable Docking Cart

Wide Range of Probes
